OCT 0 8 2004 S/I

S/N 10/021,098 <u>PATENT</u>

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Applicant:

Howard Fingerhut

Examiner:

Randy Peaches

Serial No.:

10/021,098

Group Art Unit:

2681

Filed:

December 12, 2001

Docket No.:

60027.0043US01/BS00345

Title:

Method and System for Providing Entry Node Location in a Wireless

Telecommunications System

CERTIFICATE UNDER 37 CFR 1.8:

I hereby certify that this correspondence is being deposited with the United States Postal Service as first class mail, with sufficient postage, in an envelope addressed to: Commissioner for Patents, Washington, D.C. 20231 on October 4, 2004.

Murrell W. Blackburn, Reg. No. 50,881

DECLARATION OF HOWARD FINGERHUT UNDER 37 C.F.R. §1.131

Howard Fingerhut declares that:

1.

This declaration is to establish completion of the invention in this application in the United States on a date prior to October 4, 2001.

2.

I am the inventor of the invention described in U.S. Patent Application Serial No. 10/021,098 filed on December 12, 2001, entitled " Method and System for Providing Entry Node Location in a Wireless Telecommunications System."

3.

I was an employee of BellSouth Corporation, assignee for the above-identified patent application, at the time the invention described and claimed in this patent application was invented, and I am no longer employed by BellSouth Corporation.

4.

I conceived, in this country, the invention as described and claimed in the aboveidentified patent application prior to October 4, 2001 and coupled with due diligence prior to October 4, 2001, subsequently reduced the invention to practice. In support thereof, the following materials are attached.

A specification detailing the design of the invention by the inventor prior A. to October 4, 2001. The specification is attached hereto as EXHIBIT 1.

5.

All statements made herein of my own knowledge are true and all statements made on information and belief are believed to be true, and further, these statements are made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment or both under §1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patents issuing thereon.

Entry Node Location

<u>Abstract</u>

This function provides how access to mobile location information for traffic initiated by a mobile or as a result of a POSACK generated by a base to indicate the receipt of a packet sent to a mobile.

This function will only be enabled for hosts capable of accepting the additional information.

The ability to comble and disable this functionality on a Host subscription record will enable us to control access and bill for this value added service.

To minimize operational burden the host should be able to enable and disable this functionality. When enabled all packets received by the host will contain entry node location information. (NOTE: It is assumed that billing will be done based on the access to this feature rather than usage of it.)

Terminology

POSACK Positive Acknowledgement of packet sent to a mobile generated in response to an RF The sender or originator of the process in a monoi generated in response to an KI ACK indicating that the mobile has received the process. The sender or originator of the process, in the case of a POSACK the A-Party is the Mobile and the Empt Node is the Base station generating the POSACK. The mode natirest contained in the traffic log associated with the A-Party. Is any, fixed terminal connected to the network via a MOX connection. A-Party Entry Node Host CALEA CALEA is the Commission on Accreditation for Low Enforcement Agencies. CALEA compliance is US legal requirements for surveillance of wireless users.

Is has become apparent that the knowledge of a mobile's location is critical in many exports of the wireless

Potential Applications

- Location specific content can only be provided if the location of the recipient is known. Requiring the user to enter the location is not always practical or possible.

 A host, with far more traffic handling capability then a radio channel, cannot be expected to manage the load that it places on a base station if it cannot determine what base station is being
- wised by its mobile fleet.

 Service providers and resellers may be required to provide user location information in oddition to message content to be CALEA compliant,
- Proper billing and maxim of wireless service requires knowledge of the location of the customer using the service. This information, while available to the operator in the form of traffic logs, is not available to service providers and resellers. Even if traffic togs were available it is not possible to ste truffic log records to service transactions.

 When traffic is passed from one network to another more than data content may be needed. The
- handoof of network entry information to an intermediate activork can be supported when more then one network is used to carry traffic from a user. This will enable all of the above applications even when more than one access network is used.

History

First version.

Functional Overview

General

Information related to entry node is commined in a martic log that moves through the network along with the user packer. The muffix log is updated with information as it moves through the network. At the network exit point the user traffic and traffic logs are separated. The MOX should add entry node information prior to suparation of the user packet and traffic log, based on a host MAN subscription flag. If
